ThEdu'17 – Theorem Proving components for Educational
Software

Summary

- GeoGebra
- Automated Reasoning Tools (ART) in GeoGebra
 - Deriving relations
 - Proving
 - Discovering

What is GeoGebra?

- Hohenwarter, M. (2002). "Ein Softwaresystem für dynamische Geometrie und Algebra der Ebene". Master's thesis. Salzburg University.
- GeoGebra is dynamic mathematics software for all levels of education that brings together geometry, algebra, spreadsheets, graphing, statistics and calculus in one easy-to-use package.
- In 2013, Bernard Parisse's Giac was integrated into GeoGebra's CAS view.
- GeoGebra is a rapidly expanding community of about forty millions users, located in just about every country. Available in many languages. GeoGebra Materials: 1 million resources (April 2016)
- Desktop, web, tablet, smartphone versions.
- Open source software freely available for non-commercial users
- <https://en.wikipedia.org/wiki/GeoGebra>

GeoGebra

The limited expression power of Relation

A screenshot of a web browser showing a GeoGebra wiki page. The address bar shows the URL: https://wiki.geogebra.org/en/Relation_Command. The page title is "Relation Command". The content area starts with a section titled "Relation[<List>]" which describes it as showing a message box for relations between up to 4 objects. Below this is another section titled "Relation[<Object>, <Object>]" which describes it as showing a message box for relations between two objects. A bulleted list follows, detailing various types of relations that can be checked: two lines are perpendicular, two lines are parallel, two (or more) objects are equal, a point lies on a line or conic, a line is tangent or a passing line to a conic, three points are collinear, three lines are concurrent (or parallel), and four points are concyclic (or collinear).

Relation[<List>]

Shows a message box that gives you information about the relation between two or more (up to 4) objects.

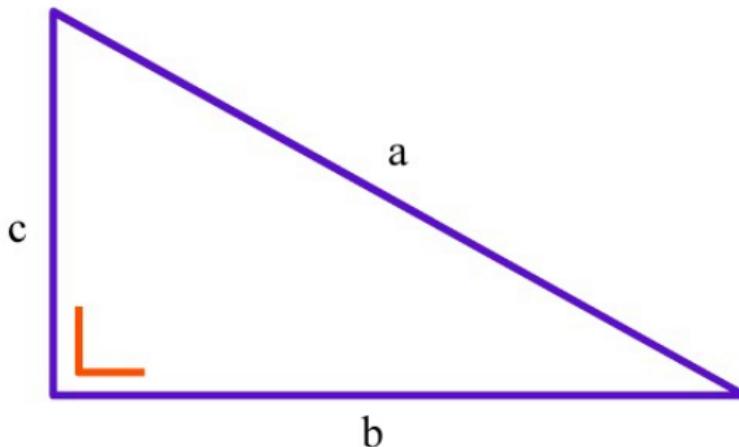

Relation[<Object>, <Object>]

Shows a message box that gives you information about the relation between two objects.

This command allows you to find out whether

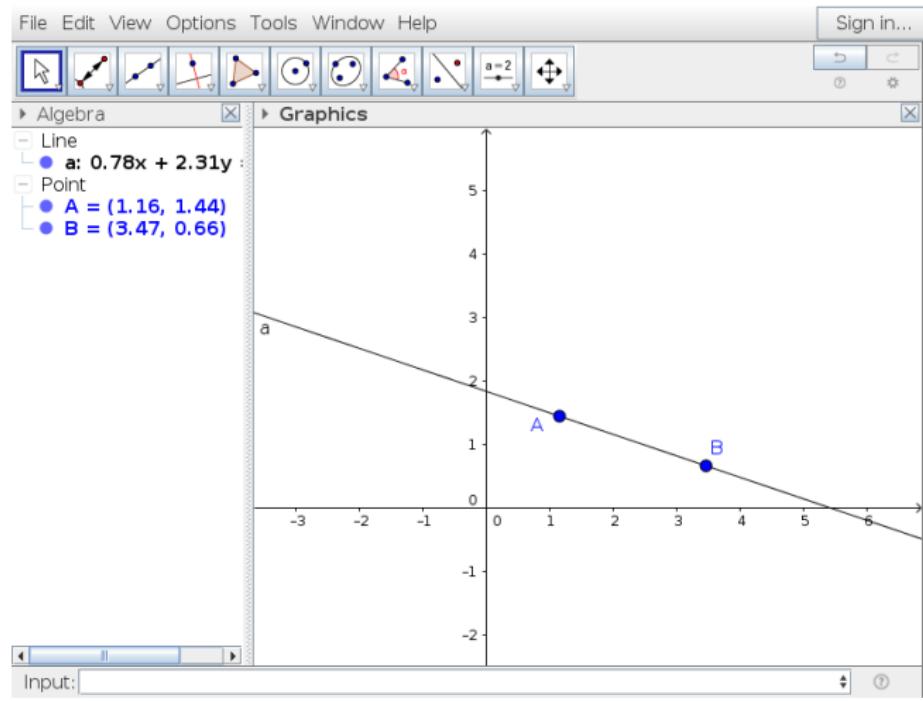

- two lines are perpendicular
- two lines are parallel
- two (or more) objects are equal
- a point lies on a line or conic
- a line is tangent or a passing line to a conic
- three points are collinear
- three lines are concurrent (or parallel)
- four points are concyclic (or collinear).

Automated proving: Pythagorean theorem through Relation?

Automated discovering

Conclusion

- What could be the role of knowing geometric properties if a simple, widely accessible, free tool can automatically
 - FIND
 - VERIFY
 - DISCOVERproperties well beyond our personal ability?
- What is the pedagogical role of knowing facts?

Conclusion

- As an auxiliary tool, what opportunities, what differences involve using GeoGebra ART?
- Can guide student exploration, provide hints, answer (partially) questions...
- Can help building up diagrams, locus...
- Helping teachers!

Thank you!
